ABSTRACT:

Disclosed herein is a rational, multi-tier approach to the administration of growth factor proteins in the treatment of heart disease. Also disclosed is a method to evaluate the effectiveness of the administration of growth factor proteins comprising

the clinical assay of CPK-MB levels in a patient undergoing treatment with growth factor proteins. In addition, there is disclosed a method for treatment of heart disease comprising administration of a therapeutically effective amount of a growth factor protein by oral inhalation therapy.

ABSTRACTED-PUB-NO: US20020058612A

BASIC-ABSTRACT:

NOVELTY - Treatment of heart disease comprising multi-tiered administration of growth factors.

DETAILED DESCRIPTION - Systematic multi-tiered treatment of heart disease comprises delivery of therapeutic growth factor proteins (GFP) by:

- (a) oral inhalation of at least one dose of an effective amount of a first therapeutic GFP formulation in a patient displaying symptoms of heart disease;
- (b) monitoring levels of CPK-MB in the patient;
- (c) determining whether administration of the GFP formulation was effective in treating the symptoms;
- (d) administering one or ore additional doses of a second GFP formulation by a delivery method more invasive than oral inhalation; and
- (e) repeating steps (b)-(d) until there is a clinical indication of amelioration of the symptoms of heart disease in the patient, or until there is a contraindication to continued treatment.

INDEPENDENT CLAIMS are also included for the following:

- (1) administration of therapeutic amounts of GFP formulation for treatment of heart disease by inhalation;
- (2) monitoring clinical effectiveness of administration of a GFP formulation in the treatment of heart disease comprising:
 - (i) performing an assay on a sample of biological fluid from a patient displaying symptoms of heart disease to determine the amount of CPK-MB present in the fluid;
 - (ii) administering a therapeutic amount of GFP formulation to the patient; and

(iii) repeating steps (i) and (ii) until the assayed amount of CPK-MB in the biological fluid has decreased by an amount sufficient to indicate the clinical effectiveness of the administration of the GFP formulation.

ACTIVITY - Cardiant. Pellets containing 10 or 100 micro g basic fibroblast growth factor (bFGF) or placebo were placed on the epicardial surface in patients with a viable and ischemic myocardial area that could not be revascularized, during coronary artery bypass surgery. After 16 months patients were angina free with the exception of 3 people in the placebo group and 1 patient who received the 10 micro g pellet.

MECHANISM OF ACTION - Angiogenesis stimulator.

USE - The method is used for the treatment of heart disease, where the symptoms are chronic or acute, especially where the symptoms are brought on by myocardial infarction, unstable angina, acute anginal attack or reperfusion injury, preferably induced by thrombolytic therapy, bypass surgery or angioplasty (claimed).

ADVANTAGE - Inhalation is the least invasive method of delivering the growth factors to the lungs. Prior are invasive approaches have not been successful in promoting angiogenesis. The pericardial space serves as a drug delivery reservoir for delivery of therapeutic agents to the heart. Use of a catheter avoids the need for open chest surgery. Intravenous infusions are practical, low cost and can be used in a broad group of patients. Treatment can be repeated easily and may not require any special facilities.

TITLE: Method of treating the heart for myocardial infarction

DATE-ISSUED: October 20, 1981

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Franco; Wayne P.	Wethersfield	CT	06109	

US-CL-CURRENT: 424/565; 514/21

ABSTRACT:

The heart is treated with fibroblast growth factor to alleviate conditions caused by myocardial infarctions as by reducing the size of damaged heart areas. An effective dose of fibroblast growth factor when applied to the heart is found to increase blood flow in affected areas for a period of at least 4 hours and often more.

ABSTRACTED-PUB-NO: US 4378347A
BASIC-ABSTRACT:

A dose of fibroblast growth factor (FGF) effective for treating the heart, suspended in a slow-release carrier for use in treatment of ischaemic heart disease is claimed. The carrier pref. comprises dextran beads. Admin. is pref. by direct injection into the heart, the dosage being 0.01-1000 mg per 100 g of heart. Intravenous, subcutaneous or oral admin. is also possible.

Admin. of the dose after myocardial infarction produces a sustained increase in blood flow in and around the damaged areas of myocardium and reduces the extent of damage.

ABSTRACTED-PUB-NO: GB 2090528B
BASIC-ABSTRACT:

Treatment of an area in the heart of a patient subjected to ischemic heart disease comprises admin. of fibroblast growth factor (FGF) to the heart.

After the treatment blood flow is increased for sustained periods after myocardial infarction. The treatment is useful after myocardial infarction (or when there is an indication of impending myocardial infarction), when blood flow is increased in the treatment area and in surrounding areas. It is also useful with heart surgery procedures e.g. coronary by-pass operations, to reduce the quantity of myocardium

damage due to ischemic disease. FGF is a known mitogenic agent for a variety of mesodermal cells in vitro and it has been used to increase vascularisation in the cornea of laboratory animals. Dose is 10 micrograms-1g.100g heart by direct injection, esp. intravenously. The treatment is useful in man, cats, dogs, cows, etc.

ABSTRACTED-PUB-NO:

US 4296100A EQUIVALENT-ABSTRACTS:

A composition for use in the treatment of ischemic heart disease, comprising fibroblast growth factor (FGF) in association with a carrier material which ensures a slow release of the FGF therefrom, the carrier material being dextran or an albumin macro-aggregate.

ABSTRACTED-PUB-NO: WO 9211439A

BASIC-ABSTRACT:

The device for handling long elements has an upper frame (10) carried by a mobile machine (1) and an intermediate frame (20) is mounted on the upper frame. This intermediate frame can perform a movement of inclination with respect to the upper frame. In its turn the intermediate frame supports a lower frame (30) which can move in a longitudinal direction.

On the lower frame is a grip (40) capable of lifting the long elements and holding them. The power take off is a hydraulic power take-off.

USE/ADVANTAGE - Gives independent control to grip and hold long elements such as pipes.

ABSTRACT:

The invention is based on the discovery that a viral VEGF-like protein from the orf virus strain NZ2 and from the orf virus strain NZ10 is capable of binding to the extracellular domain of the VEGF receptor-2 to form bioactive complexes which mediate useful cellular responses and/or antagonize undesired biological activities. Disclosed are methods which stimulate or inhibit these biological activities, methods for therapeutic applications and antagonists of ORFV2-VEGF and/or NZ10.

ABSTRACT:

The invention relates generally to compositions useful in altering the migration and/or proliferative activity of cells and to methods of using them. Reagents that can regulate cell migration and reorganization are useful in managing diseases in which cell migration and tissue remodeling play a role, including inhibiting vascular stenosis and restenosis that can result from endothelial injury. Migration-altering compositions include the proteins clusterin and gp38k and fragments thereof which retain the migration-altering activity, peptides derived from the proteins which possess the migration-altering activity, polyclonal, monoclonal and recombinant humanized antibodies directed against the proteins and fragments thereof and anti-sense oligonucleotides capable of binding clusterin and gp38k mRNAs.

604/500

ABSTRACT:

Novel forms of vascular endothelial growth factor genes and the novel proteins encoded by these genes are disclosed. More particularly, novel forms of human VEGF-A which contain exon 6b and do not contain exon 6a are disclosed. Other novel forms of human VEGF-A contain exon 6b in addition to exon 6a. These novel forms of VEGF-A include VEGF-A.sub.138, VEGF-A.sub.162, and VEGF-A.sub.182. Such novel VEGF proteins may be used in treatment of the cardiovascular system and its diseases through effects on anatomy, conduit function, and permeability, and more particularly in the treatment of cardiovascular disease by stimulating vascular cell proliferation using a growth factor, thereby stimulating endothelial cell growth and vascular permeability.

The invention also relates to nucleic acids encoding such novel VEGF proteins, cells, tissues and animals containing such nucleic acids; methods of treatment using such nucleic acids; and methods relating to all of the foregoing.

ABSTRACT:

The present invention relates to novel reproductive system related polynucleotides and the polypeptides encoded by these polynucleotides herein collectively known as "reproductive system related antigens," and the use of such reproductive system related antigens for detecting disorders of the reproductive system, particularly the presence of cancers and cancer metastases. More specifically, isolated reproductive system associated nucleic acid molecules are provided encoding novel reproductive system associated polypeptides. Novel reproductive system related polypeptides and antibodies that bind to these polypeptides are provided. Also provided are vectors, host cells, and recombinant and synthetic methods for producing human reproductive system associated polynucleotides and/or polypeptides. The invention further relates to diagnostic and therapeutic methods useful for diagnosing, treating, preventing and/or prognosing disorders related to the reproductive system, including reproductive system cancers, and therapeutic methods for treating such disorders. The invention further relates to screening methods for identifying agonists and antagonists of polynucleotides and polypeptides of the invention. The present invention further relates to methods and/or compositions for inhibiting the production and function of the polypeptides of the present invention.

ABSTRACT:

The present invention relates to antibodies and related molecules that immunospecifically bind to BLYS. The present invention also relates to methods and compositions for detecting or diagnosing a disease or disorder associated with aberrant BLYS expression or inappropriate function of BLYS comprising antibodies or fragments or variants thereof or related molecules that immunospecifically bind to BLYS. The present invention further relates to methods and compositions for preventing, treating or ameliorating a disease or disorder associated with aberrant BLYS expression or inappropriate BLYS function comprising administering to an animal an effective amount of one or more antibodies or fragments or variants thereof or related molecules that immunospecifically bind to BLYS.

ABSTRACT:

A new circulating form of soluble human tissue factor was identified. This new form of human tissue factor appears to be the result of alternative splicing and is therefore referred to as "alt-hTF." Alt-hTF mRNA was detected in a cell line, HL-60. The cDNA region encoding the entire open reading frame of alt-hTF was cloned. The sequence encoding the alt-hTF mature peptide was expressed in bacteria. alt-hTF consists of the first 166 amino acids of membrane bound TF, and a 40 amino acid C-terminal region unique to alt-hTF. Alt-hTF is likely to be a useful target for compounds to inhibit clotting and to treat disorders associated with elevated TF. It may also be useful as a target for antibodies selectively reactive with alt-hTF, to remove it from the circulation for treatment of clotting or other disorders associated with elevated or abnormal levels of TF, including thrombotic conditions, cardiovascular disorders, DVT, DIC, and possibly metastatic cancers.

ABSTRACT:

Disclosed are human VEGF-2 polypeptides, biologically active, diagnostically or therapeutically useful fragments, analogs, or derivatives thereof, and DNA(RNA) encoding such VEGF-2 polypeptides. Also provided are procedures for producing such polypeptides by recombinant techniques and antibodies and antagonists against such polypeptides. Such polypeptides and polynucleotides may be used therapeutically for stimulating wound healing and for vascular tissue repair. Also provided are methods of using the antibodies and antagonists to inhibit tumor angiogenesis and thus tumor growth, inflammation, diabetic retinopathy, rheumatoid arthritis, and psoriasis.

ABSTRACT:

The invention relates to novel nucleic acids encoding a fibroblast growth factor-23 (FGF23) and proteins encoded thereby, mutations in which are associated with autosomal dominant rickets (ADHR). The invention further relates to methods of diagnosing and treating hypophosphatemic and hyperphosphatemic disorders comprising inhibiting or stimulating, respectively, the biological activity of FGF23 in a patient. The invention also relates to methods of treating osteoporosis, dermatomyositis, and coronary artery disease comprising stimulating the biological activity of FGF23 in a patient.

ABSTRACT:

The present invention relates to novel cardiovascular system related polynucleotides and the polypeptides encoded by these polynucleotides herein collectively known as "cardiovascular system antigens," and the use of such cardiovascular system antigens

for detecting disorders of the cardiovascular system, particularly the presence of cancer of cardiovascular system tissues and cancer metastases. More specifically, isolated cardiovascular system associated nucleic acid molecules are provided encoding novel cardiovascular system associated polypeptides. Novel cardiovascular system polypeptides and antibodies that bind to these polypeptides are provided. Also provided are vectors, host cells, and recombinant and synthetic methods for producing human cardiovascular system associated polynucleotides and/or polypeptides. The invention further relates to diagnostic and therapeutic methods useful for diagnosing, treating, preventing and/or prognosing disorders related to the cardiovascular system, including cancer of cardiovascular system tissues, and therapeutic methods for treating such disorders. The invention further relates to screening methods for identifying agonists and antagonists of polynucleotides and polypeptides of the invention. The present invention further relates to methods and/or compositions for inhibiting the production and function of the polypeptides of the present invention.

ABSTRACT:

An angiogenic factor comprising a mixture of proteins derived from bone. The angiogenic protein mixture is produced by a series of steps that allow the proteins to be kept in solution. The angiogenic mixture of bone proteins is produced by a multi-step process that includes at least one ultrafiltration step, an anion exchange chromatography step, a cation exchange chromatography step and a high performance liquid chromatography (HPLC) purification step.

ABSTRACT:

A 2.4 .ANG. crystal structure of a protein construct containing the catalytic kinase domain of vascular endothelial growth factor receptor 2 (VEGFR2/KDR), a key enzyme in angiogenesis, has been determined in an unliganded, phosphorylated state. This protein construct, contains a modified catalytic linker and has comparable in vitro kinase activity to constructs containing the entire KID. The resulting construct retains comparable in vitro kinase activity to that of the wild-type KID, and more importantly, allows complete crystallization of the protein such that it may be characterized by X-ray crystallography. The present invention further discloses the use of ray crystallographic data for identification and construction of possible therapeutic compounds in the treatment of various disease conditions.

ABSTRACT:

The present invention relates to 36 novel human secreted proteins and isolated nucleic acids containing the coding regions of the genes encoding such proteins. Also provided are vectors, host cells, antibodies, and recombinant methods for producing human secreted proteins. The invention further relates to diagnostic and therapeutic methods useful for diagnosing and treating disorders related to these novel human secreted proteins.

ABSTRACT:

The invention provides isolated nucleic acids molecules, designated HATF-1 and HRP-1 nucleic acid molecules, which are differentially expressed in hypertensive humans, rats, and mice. The invention also provides antisense nucleic acid molecules, recombinant expression vectors containing HATF-1 or HRP-1 nucleic acid molecules, host cells into which the expression vectors have been introduced, and nonhuman transgenic animals in which an HATF-1 or HRP-1 gene has been introduced or disrupted. The invention still further provides isolated HATF-1 and HRP-1 proteins, fusion proteins, antigenic peptides and anti-HATF-1 and anti-HRP-1 antibodies. Diagnostic methods utilizing compositions of the invention are also provided.

ABSTRACT:

The present invention relates to polynucleotide and polypeptide molecules for zFGF5 a novel member of the FGF family. The polypeptides, and polynucleotides encoding them, are proliferative for muscle cells, in particular cardiac cells and may be used for remodeling cardiac tissue and improving cardiac function. The present invention also includes antibodies to the zFGF5 polypeptides.

TITLE: Angiogenically effective unit dose of FGF-2 and method of use

DATE-ISSUED: August 27, 2002

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Whitehouse; Martha Jo	San Francisco	CA		

US-CL-CURRENT: 514/12; 424/423, 424/85.2, 424/94.4, 435/69.4, 514/2, 514/358,
514/410, 514/411, 514/54, 514/56, 530/350 , 530/380, 530/381, 530/383, 530/399,
536/17.2, 536/21, 604/101.03

ABSTRACT:

The present invention has multiple aspects. In particular, in one aspect, the present invention is directed to a unit dose composition comprising 0.2 .mu.g/kg to 48 .mu.g/kg of an FGF-2 of SEQ ID NO: 2, or an angiogenically active fragment or mutein thereof in a pharmaceutically acceptable carrier. In another aspect, the present invention is directed to a method for treating a human patient for coronary artery disease, comprising administering into one or more coronary vessels or a peripheral vein of a human patient in need of treatment for coronary artery disease a safe and angiogenically effective dose of a recombinant FGF-2, or an angiogenically active fragment or mutein thereof. The single unit dose composition of the present invention provides an angiogenic effect in a human CAD patient that lasts six months before re-treatment is required. In another aspect, the present invention is directed to a method of administration which optimizes patient's safety. In this embodiment, fluids, heparin and/or rate of infusion all play a role. In another aspect, the present invention is directed to a pharmaceutical composition comprising a therapeutically effective amount of FGF-2, alone or in combination with heparin, in a therapeutically effective carrier. The magnitude and duration of benefit were unexpected; in addition benefit with the IV route was unexpected.

ABSTRACT:

An angiogenic factor comprising a mixture of proteins derived from bone. The angiogenic protein mixture is produced by a series of steps that allow the proteins to be kept in solution. The angiogenic mixture of bone proteins is produced by a multi-step process that includes at least one ultrafiltration step, an anion exchange chromatography step, a cation exchange chromatography step and a high performance liquid chromatography (HPLC) purification step.

US-CL-CURRENT: 514/12; 530/399, 600/18, 601/152, 606/194

ABSTRACT:

A method for enhancing such biobypass techniques as angiogenesis, trans-myocardial revascularization, percutaneous myocardial revascularization, and myocardial cell proliferation by using the means for increasing of coronary blood flow to both instantly relieve the ischemic symptoms and stimulate the growth of new blood vessels. Intra-aortic balloon pumping and other counterpulsation means are identified as preferred means for increasing of coronary blood flow.

ABSTRACT:

The present invention relates to methods and compositions for the treatment and diagnosis of cardiovascular disease, including, but not limited to, atherosclerosis, ischemia/reperfusion, hypertension, restenosis, and arterial inflammation. Specifically, the present invention identifies and describes genes which are differentially expressed in cardiovascular disease states, relative to their expression in normal, or non-cardiovascular disease states, and/or in response to manipulations relevant to cardiovascular disease. Further, the present invention identifies and describes genes via the ability of their gene products to interact with gene products involved in cardiovascular disease. Still further, the present invention provides methods for the identification and therapeutic use of compounds as treatments of cardiovascular disease. Moreover, the present invention provides methods for the diagnostic monitoring of patients undergoing clinical evaluation for the treatment of cardiovascular disease, and for monitoring the efficacy of compounds in clinical trials. Additionally, the present invention describes methods for the diagnostic evaluation and prognosis of various cardiovascular diseases, and for the identification of subjects exhibiting a predisposition to such conditions.

ABSTRACT:

A method is disclosed for attenuating stenosis after balloon angioplasty. The method comprises administering to a host parenterally or locally to the luminal surface of the blood vessel subjected to said balloon angioplasty an effective amount of tissue factor pathway inhibitor (TFPI) for a prolonged period of time sufficient to substantially reduce the extent of restenosis. An exemplary amount of the TFPI is from about 0.5 mg/kg to about 6 mg/kg during a prolonged administration of about twelve (12) hours to 36 hours.

ABSTRACT:

The invention relates generally to peptides which decrease the half-life of active plasminogen activator inhibitor-1. This invention further relates to methods and compositions for using peptides which decrease the half-life of active plasminogen activator inhibitor-1. Further, the invention includes methods and compositions useful in clot lysis.

TITLE: System for analyzing and processing orders related to healthcare treatment or services

PUBLICATION-DATE: August 5, 2004

INVENTOR-INFORMATION:

NAME	CITY	STATE	COUNTRY	RULE-47
Brandt, Samuel I.	Malvern	PA	US	
Scherpbier, Harm J.	Fort Washington	PA	US	

US-CL-CURRENT: 705/2

ABSTRACT:

A system analyzes data including healthcare orders initiating treatment or services used in patient healthcare. The system includes a data processor and a message processor. The data processor identifies a potential change in use of a particular treatment by examining data, representing multiple orders generated over a particular time period, used in treating multiple patients to identify a number of orders initiating application of a particular treatment to individual patients of the multiple patients to address a particular medical condition. The data processor also determines whether the number of orders exceeds a predetermined threshold and/or whether a rate of change in the number of orders relative to a previously determined number of orders is significant. The message processor initiates generation of a message to alert a message recipient of an identified potential change in use of the particular treatment.

US-CL-CURRENT: 514/172

ABSTRACT:

The present invention provides methods for the treatment or prophylaxis of one or more aldosterone-mediated pathogenic effects in a subject suffering from or susceptible to the pathogenic effect or effects wherein the subject has one or more conditions selected from the group consisting of a sub-normal endogenous aldosterone level, salt sensitivity and an elevated dietary sodium intake. The methods comprise administering to the subject a therapeutically-effective amount of one or more epoxy-steroidal compounds that are aldosterone antagonists.

TITLE: Triple therapy of angiotensin converting enzyme inhibitor epoxy-steroidal aldosterone antagonist and diuretic or digoxin for treatment of cardiovascular disease

PUBLICATION-DATE: April 22, 2004

INVENTOR-INFORMATION:

NAME	CITY	STATE	COUNTRY	RULE-47
Alexander, John C.	Princeton	NJ	US	
Roniker, Barbara	Chicago	IL	US	
Desai, Subhash	Wilmette	IL	US	

ABSTRACT:

Combinations of an ACE inhibitor and an epoxy-steroidal aldosterone receptor antagonist are described for use in treatment of circulatory disorders. Of particular interest are therapies using epoxy-steroidal-type aldosterone receptor antagonist compounds, such as eplerenone, in combination with an angiotensin converting enzyme inhibitor. This co-therapy would be particularly useful to treat congestive heart failure while avoiding or reducing aldosterone-antagonist-induced side effects such as hyperkalemia.

PUBLICATION-DATE: November 27, 2003

INVENTOR-INFORMATION:

NAME	CITY	STATE	COUNTRY	RULE-47
Schuh, Joseph R.	St. Louis	MO	US	

US-CL-CURRENT: 514/173; 514/175

ABSTRACT:

A combination therapy comprising a therapeutically-effective amount of an epoxy-steroidal aldosterone receptor antagonist and a therapeutically-effective amount of a calcium channel blocker is described for treatment of circulatory disorders, including cardiovascular disorders such as hypertension, angina and congestive heart failure. Preferred calcium channel blockers are those compounds having high potency and bioavailability. Preferred epoxy-steroidal aldosterone receptor antagonists are 20-spiroxane steroidal compounds characterized by the presence of a 9.alpha.,11.alpha.-substituted epoxy moiety. A preferred combination therapy includes the calcium channel blocker amlodipine and the aldosterone receptor antagonist eplerenone.

TITLE: Screening test and procedure using apocrine sweat

PUBLICATION-DATE: October 23, 2003

INVENTOR-INFORMATION:

NAME	CITY	STATE	COUNTRY	RULE-47
Berlin, Stuart M.	Thousand Oaks	CA	US	

US-CL-CURRENT: 600/346

ABSTRACT:

Marker compounds indicative of variations in physiological conditions, genetic defects or disease states have been found to be present in apocrine sweat and, in many conditions, these markers are present in apocrine sweat in elevated levels when compared to blood. These markers are collected and/or detected in apocrine sweat and used as an indicator that a disease state or particular physiological condition exists. A skin patch, wipe or other collection means is used to collect apocrine sweat. The apocrine sweat is then used to indicate the existence of a disease state or changing physiological condition by the presence of specific marker compounds.

Apocrine sweat can also be collected from individuals known to have a specific disease or physiological condition and, by comparison with apocrine sweat from normal individuals, used to identify new markers indicative of the specific disease state or physiological condition.

TITLE: Pyruvate cardioplegia solutions for administration to the heart during cardiopulmonary surgery and methods of use thereof

PUBLICATION-DATE: July 3, 2003

INVENTOR-INFORMATION:

NAME	CITY	STATE	COUNTRY	RULE-47
Olivencia-Yurvati, Albert H.	Southlake	TX	US	
Mallet, Robert T.	Weatherford	TX	US	

US-CL-CURRENT: 435/1.1; 514/23, 514/3, 514/557

ABSTRACT:

The invention includes a novel cardioplegia solution in which pyruvate serves as the primary energy source. The solution may be used in any surgery where the heart must be arrested, but it is particularly useful in cardiopulmonary bypass surgery. Because the solution relies primarily upon pyruvate to protect the heart from damage during and immediately after arrest, other additives are not as necessary as with current cardioplegia solutions or are not necessary at all. The invention also includes a method for making the cardioplegia solution and a process of performing cardiopulmonary bypass surgery using the novel cardioplegia solution.

Singh, Rajendra	San Jose	CA	US	
Mehta, Harshvardhan	Fremont	CA	US	

US-CL-CURRENT: 514/54; 536/123

ABSTRACT:

Compounds that are modified polysaccharides having pendant aldehyde functionalities are disclosed. Each of the aldehyde functionalities is attached through a linker to a

position corresponding to a hydrogen atom of a different hydroxyl group of unmodified polysaccharide. Also disclosed is a method for introducing an amine-reactive functionality into a dextran. The method comprises (a) reacting the dextran with an alkylating agent having a functionality that reacts with an hydroxyl group of the dextran thereby forming an alkylated dextran wherein the alkylating agent has an olefin group and (b) treating the alkylated dextran to convert the olefin group to an amine-reactive functionality. A polysaccharide can be conjugated to a biomolecule by carrying out the above method and reacting the amine-reactive functionality with an amine functionality on the biomolecule to produce polysaccharide conjugated to the biomolecule.

TITLE: Screening test and procedure using skin patches

PUBLICATION-DATE: August 22, 2002

INVENTOR-INFORMATION:

NAME	CITY	STATE	COUNTRY	RULE-47
Berlin, Stuart	Thousand Oaks	CA	US	

US-CL-CURRENT: 600/362

ABSTRACT:

Marker compounds indicative of variations in physiological conditions, genetic defects or disease states have been found to be present in apocrine sweat and, in many conditions, these markers are present in apocrine sweat in elevated levels when compared to blood. These markers are collected and/or detected in apocrine sweat and used as an indicator that a disease state or particular physiological condition exists. A skin patch, wipe or electronic detector for vapors released from apocrine sweat are used to indicate the existence of a disease state or changing physiological condition. The patch or wipe can include monoclonal antibodies or other chemical compounds that can indicate the presence of specific markers. This may include indicators that render visible, the existence of a reaction between the monoclonal antibody or chemical compound and the marker compound to indicate the existence of the condition being tested for. Various different disease states can be detected

including, but not limited to heart disease, cancer, autoimmune disease, viral or bacterial disease, renal disease, drug intoxication and other systemic illnesses. Fertility for conception and histocompatibility for organ transplantation of individuals should also be detectable.

ABSTRACT:

A method is disclosed for inhibiting calpain by contacting calpain with one or more HIV protease inhibitors or analogs. Included are embodiments for identifying subjects at risk of suffering calpain-mediated physiological damage and administering to them the HIV protease inhibitors or analogs. Alternatively, a compound may be administered to a subject following an actual event implicating activation of calpain. Also included are methods of treating or preventing calpain-mediated physiological damage in a subject by administering to the subject a therapeutically effective amount of a pharmaceutical composition which includes at least one HIV protease inhibitor or analog. The pharmaceutical compositions can be used in the treatment of a variety of conditions or diseases implicated by or associated with calpain activation, including cardiovascular diseases.

TITLE: Epoxy-steroidal aldosterone antagonist and calcium channel blocker combination therapy for treatment of congestive heart failure

PUBLICATION-DATE: April 11, 2002

INVENTOR-INFORMATION:

NAME	CITY	STATE	COUNTRY	RULE-47
Schuh, Joseph R.	St. Louis	MO	US	

US-CL-CURRENT: 514/175; 514/173

ABSTRACT:

A combination therapy comprising a therapeutically-effective amount of an epoxy-steroidal aldosterone receptor antagonist and a therapeutically-effective amount of a calcium channel blocker is described for treatment of circulatory disorders, including cardiovascular disorders such as hypertension, congestive heart failure, cirrhosis and ascites. Preferred calcium channel blockers are those compounds having high potency and bioavailability. Preferred epoxy-steroidal aldosterone receptor antagonists are 20-spiroxane steroidal compounds characterized by the presence of a 9.alpha.,11.alpha.-substituted epoxy moiety. A preferred combination therapy includes the calcium channel blocker verapamil HCl (Benzenacetoneitrile, (.+-.).alpha.[3[[2-(3,4-dimethoxyphenyl) ethyl]methylamino]propyl]-3,4-dimethoxy-.alpha.-(1-methylethyl) hydrochlor- ide) and the aldosterone receptor antagonist epoxymexrenone.

TITLE: Methods for preparing conjugates

PUBLICATION-DATE: February 28, 2002

INVENTOR-INFORMATION:

NAME	CITY	STATE	COUNTRY	RULE-47
Dellinger, Douglas J.	Sunnyvale	CA	US	
Myerson, Joel	Berkeley	CA	US	
Fulcrand, Geraldine	Sunnyvale	CA	US	
Ilsley, Diane D.	San Jose	CA	US	

US-CL-CURRENT: 435/7.1

ABSTRACT:

Methods are disclosed for conjugating one moiety to another moiety. In the method the moieties are reacted with one another in a protic solvent. Reaction between the moieties and the protic solvent during the conjugating is negligible or reversible. A stable bond is formed between the moieties to produce a product that is not subject to .beta.-elimination at elevated pH. Usually, one of the moieties comprises an

unsaturation between two carbon atoms. One of the carbon atoms is or becomes an electrophile during the conjugating. The other of the moieties comprises a functionality reactive with the electrophile carbon atom to form a product that comprises the unsaturation. Compounds comprising both of the moieties as well as precursor molecules are also disclosed. Methods are also disclosed for determining an analyte in a sample employing compounds as described above.

436/817, 436/901

ABSTRACT:

Methods, compositions and kits are disclosed. The methods are directed to determining the presence of one or more analytes in a sample suspected of containing any one of a plurality of the analytes. A combination is provided comprising in a medium (i) the sample, (ii) a binding partner for each of the analytes, (iii) for each of the analytes, a first reagent comprising a member of a signal producing system, a ligand and an analyte analog, and (iv) a second reagent comprising a binding partner for the ligand. The binding of the binding partner for the ligand is affected by the presence of an analyte and alters the amount of signal produced by the member of the signal producing system. The signal thus is modulated if one or more of the analytes are present in the sample. The amount of the signal is determined and is related to the presence of one or more of the analytes in the sample. The method may be homogeneous or heterogeneous.

ABSTRACT:

Methods, compositions and kits are disclosed. The compositions are light emitting and comprise a polymeric matrix having dissolved therein a photoactive compound. The composition has the characteristic that, after activation of the photoactive compound, the rate of decrease in the intensity of light emission at any time during a 20-fold decrease in the intensity is proportional to the intensity of the light emission. In one embodiment the polymeric matrix is comprised of particles of about 20 nm to about 100 .mu.m in diameter to which is bound a specific binding pair member. The particles generally comprise a polymeric matrix having dissolved therein about 1 to about 20% by weight of a dopant. The compositions may be used in methods for determining an analyte. A combination is provided comprising (1) a medium suspected of containing the analyte, (2) and the aforementioned composition. The photoactive substance is activated and the effect of the activating on the optical properties of the combination is detected. The presence and amount of the effect is related to the presence and amount of the analyte in the medium. Also disclosed are

kits for use in an assay.

US-CL-CURRENT: 514/54; 514/367, 514/59, 524/54, 536/51

ABSTRACT:

Compounds that are modified polysaccharides having pendant aldehyde functionalities are disclosed. Each of the aldehyde functionalities is attached through a linker to a position corresponding to a hydrogen atom of a different hydroxyl group of unmodified polysaccharide. Also disclosed is a method for introducing an amine-reactive functionality into a dextran. The method comprises (a) reacting the dextran with an alkylating agent having a functionality that reacts with an hydroxyl group of the dextran thereby forming an alkylated dextran wherein the alkylating agent has an olefin group and (b) treating the alkylated dextran to convert the olefin group to an amine-reactive functionality. A polysaccharide can be conjugated to a biomolecule by carrying out the above method and reacting the amine-reactive functionality with an amine functionality on the biomolecule to produce polysaccharide conjugated to the biomolecule.

ABSTRACT:

Methods are disclosed for determining an analyte in a medium suspected of containing the analyte. One method comprises treating a medium suspected of containing an analyte under conditions such that the analyte, if present, causes a photosensitizer and a chemiluminescent compound to come into close proximity. The photosensitizer generates singlet oxygen and activates the chemiluminescent compound when it is in close proximity. The activated chemiluminescent compound subsequently produces light. The amount of light produced is related to the amount of analyte in the medium. Preferably, at least one of the photosensitizer and chemiluminescent compound is associated with a surface which is usually a suspendible particle, and a specific binding pair member is bound thereto. Compositions and kits are also disclosed.

ABSTRACT:

Methods, compositions and kits are disclosed. The methods are directed to determining the presence or relative amounts of two or more components in a medium. A combination is provided comprising a medium suspected of containing the components and a label reagent for each of the components. The label reagent comprises a chemiluminescent composition that is activated by electromagnetic radiation. A first specific binding pair (sbp) member may be associated with the reagent depending on the components to be determined. Luminescence emitted by each of the chemiluminescent compositions upon activation is differentially detectable. Where a first sbp member is employed, it is capable of binding to the component or to a second sbp member to form a complex related to the amount of the component. At least one of the chemiluminescent compositions comprises a fluorescent energy acceptor. After the above are combined, the chemiluminescent compositions are activated. The amount of luminescence generated by each of the chemiluminescent compositions is detected and related to the amount of each of the components in the medium.

Scheltes; Jules	The Hague				NL
Heikens; Martijn	Delft				NL

US-CL-CURRENT: 606/213; 606/153, 606/215

ABSTRACT:

A temporary intravascular arteriotomy seal for insertion into and retrieval from a blood vessel through an opening in the wall of the vessel. The seal comprises a thin flexible sheet material. According to one embodiment, in an untensioned state, the seal is curved and foldable in the width direction. It is adapted to be folded in the width direction upon exertion for a force on the gripping element directed in the length direction, and upon contacting of the sheet material by the sides of the opening in the vessel wall. By use of the sealing device, arterial by-pass grafting in a briefly-occlusive or non-occlusive end-to-side or side-to-side anastomosis

technique is possible with virtually no obstruction to flow, little endothelial denudation and otherwise no wall damage by the intravascular device, and without blocking of side branches. A further embodiment of a device according to the present invention is characterized in that the gripping element is formed by a supply duct which ends in an opening in the flexible sheet material for administration of substances to the supply duct into a blood vessel for rescue arterial perfusion purposes. Optionally, the seal may be inflatable.

ABSTRACT:

This invention discloses a kind of pine needle extract. The extract can be used to treat the following diseases: hypertension, coronary heart disease, angina pectoris, arrhythmia, diabetes, hyperlipemia, high blood viscosity, high blood aggregation, scleratheroma, cerebral infarction, brain scleratheroma, senile dementia, sudden deafness, etc.

ABSTRACT:

Methods are disclosed for immobilizing a substance to a surface. A surface is employed that comprises a linking group consisting of a first portion comprising a hydrocarbon chain, optionally substituted, and a second portion comprising an alkylene oxide or an alkylene imine wherein the alkylene is optionally substituted. One end of the first portion is attached to the surface and one end of the second portion is attached to the other end of the first portion chain by means of an amine or an oxy functionality. The second portion terminates in an amine or a hydroxy functionality. The surface is reacted with the substance to be immobilized under conditions for attachment of the substance to the surface by means of the linking group. Compositions of matter and reaction systems are also disclosed.

ABSTRACT:

Methods are disclosed for determining an analyte in a medium suspected of containing the analyte. One method comprises treating a medium suspected of containing an

<http://westbrs:9000/bin/gate.exe?f=TOC&state=3pgbkl.7&ref=6&dbname=PGPB,USPT,US...> 10/14/04

analyte under conditions such that the analyte, if present, causes a photosensitizer and a chemiluminescent compound to come into close proximity. The photosensitizer generates singlet oxygen and activates the chemiluminescent compound when it is in close proximity. The activated chemiluminescent compound subsequently produces light. The amount of light produced is related to the amount of analyte in the medium. Preferably, at least one of the photosensitizer and chemiluminescent compound is associated with a surface which is usually a suspendible particle, and a specific binding pair member is bound thereto. Compositions and kits are also disclosed.

ABSTRACT:

The present invention relates to compounds that are bis-biotins. These compounds comprise two biotinyl radicals connected by a chain of atoms, usually at least 16 atoms in length. The bis-biotin is conjugated to a member of a specific binding pair ("sbp member") wherein the chain is not part of the sbp member. Also disclosed are compositions comprising a complex of avidin and a bis-biotin as described above. The compounds and compositions of the invention find use in an assay for an analyte wherein there is employed a reagent system comprising an avidin reagent and a biotin reagent. The improvement of the present invention comprises using as the biotin reagent a bis-biotin as described above. Also disclosed are kits comprising the present bis-biotins and methods of preparing a bis-biotinylated conjugate of a member of a specific binding pair ("sbp member") for use in a specific binding assay.

ABSTRACT:

Compositions, methods and kits are disclosed. The compositions comprise a matrix having incorporated therein a label capable of being modified by singlet oxygen. A catalyst capable of catalyzing the formation of singlet oxygen is bound to the matrix, which permits the diffusion of singlet oxygen therein. The compositions may be used in methods for detecting hydrogen peroxide or a compound capable of generating hydrogen peroxide. A sample suspected of containing such compound is combined with a composition in accordance with the present invention. The combination is subjected to conditions wherein such compound generates hydrogen peroxide. The reaction of singlet oxygen with the label is determined, the reaction thereof indicating the presence of the compound capable of generating hydrogen peroxide.

436/536, 436/538, 436/540, 436/542, 436/824

ABSTRACT:

The present invention concerns methods for masking inhomogeneity of a member of a specific binding pair (sbp) employed in a capillary electroseparation. The method comprises binding the sbp member to synthetic particles that become localized during capillary electroseparation. Also disclosed is one embodiment of the present invention, which is a method for conducting a capillary electroseparation specific binding assay. The method involves the electroseparation of a labeled first member of a specific binding pair that is bound in a complex from labeled first member that is not bound in the complex. The complex comprises the first member and a second member of a specific binding pair. A combination is provided comprising a sample suspected of containing an analyte, a labeled first member of a specific binding pair, and a second member of a specific binding pair under conditions for forming a complex between labeled first member and the second member. The second member either initially or subsequent to the formation of the complex being covalently or noncovalently bound to synthetic particles that migrate uniformly during electroseparation. The combination is subjected to electroseparation and a determination is made as to whether the complex is formed. Also disclosed are kits for conducting a capillary electroseparation specific binding assay.

435/7.9, 436/518, 436/525, 436/528, 436/807

ABSTRACT:

An enzyme sandwich immunoassay, device and cassette therefor for determining a target analyte are described. The enzyme sandwich immunoassay cassette (B) comprises a microporous membrane support (m) having coated thereon a conductive metal layer overlaid with a capture antibody layer (e). The electrochemical device (A) comprises a first chamber (b) into which sample and an enzyme labelled antibody capable of specifically binding to the target analyte are placed, wherein the enzyme is capable of catalyzing the production of an electrochemically detectable product; a second chamber (a) adjoining the first chamber (b) into which a substrate for the enzyme is placed, wherein the substrate is capable of producing, when catalyzed by the enzyme, the electrochemically detectable product; and, separating the first (b) and second (a) chambers, a microporous membrane support (m) as described above, wherein the conductive metal layer (e) of the microporous membrane support (m) acts as an electrode to detect, directly or indirectly, the presence of the electrochemically detectable product.

Singh; Rajendra	San Jose	CA		
Mehta; Harshvardhan	Fremont	CA		

US-CL-CURRENT: 514/54; 514/367, 514/59, 524/54

ABSTRACT:

Compounds that are modified polysaccharides having pendant aldehyde functionalities are disclosed. Each of the aldehyde functionalities is attached through a linker to a position corresponding to a hydrogen atom of a different hydroxyl group of unmodified polysaccharide. Also disclosed is a method for introducing an amine-reactive functionality into a dextran. The method comprises (a) reacting the dextran with an alkylating agent having a functionality that reacts with an hydroxyl group of the dextran thereby forming an alkylated dextran wherein the alkylating agent has an olefin group and (b) treating the alkylated dextran to convert the olefin group to an amine-reactive functionality. A polysaccharide can be conjugated to a biomolecule by carrying out the above method and reacting the amine-reactive functionality with an amine functionality on the biomolecule to produce polysaccharide conjugated to the biomolecule.

ABSTRACT:

A device for performing an enzyme-labelled binding assay comprises an absorbent material and a developing solution containing a substrate for said enzyme, wherein the absorbent material is provided with a plurality of reagent zones including an indicator reagent zone and is capable of transporting the developing solution by capillary action sequentially through the reagent zones, and wherein the indicator reagent zone includes a reagent capable, directly or indirectly, of immobilizing an enzyme-labelled reagent in an amount dependent on the assay result, characterized in that the absorbent material includes a reagent that prevents a signal formation except where enzyme-labelled reagent is immobilized at the indicator reagent zone.

The absorbent material is suitably in the form of an elongate strip provided with transverse reagent zones. The device is useful for performing immunoassays, including immunometric assays and dual analyte assays.

ABSTRACT:

Methods for labeling a material are disclosed. The methods comprise combining with the material (a) a photosensitizer capable upon irradiation of generating singlet oxygen and (b) a chemiluminescent compound capable of being activated by singlet oxygen wherein the photosensitizer and the chemiluminescent compound are incorporated in a particulate matrix or a non-particulate solid matrix. The particulate matrix can

be solid or fluid. The methods allow for generating delayed luminescence, which can be realized upon irradiation of the matrix. The methods have application to the determination of an analyte in a medium suspected of containing the analyte. One method comprises subjecting a medium suspected of containing an analyte to conditions under which a complex of specific binding pair (sbp) members is formed in relation to the presence of the analyte and determining whether the sbp member complex has formed by employing as a label a single composition having both chemiluminescent and photosensitizer properties. Upon activation of the photosensitizer property singlet oxygen is generated and activates the chemiluminescent property. Compositions and kits are also disclosed.

TITLE: Binding assay device

DATE-ISSUED: June 24, 1997

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Perry; Martin John	Slough			GB2

US-CL-CURRENT: 435/7.92; 422/56, 435/25, 435/27, 435/28, 435/962, 435/963, 435/970,
435/975, 436/501, 436/514, 436/518, 436/530, 436/810, 436/817

ABSTRACT:

A device for performing an enzyme-labelled binding assay comprises an absorbent material and a developing solution containing a substrate for said enzyme, wherein the absorbent material is provided with a plurality of reagent zones including an indicator reagent zone and is capable of transporting the developing solution by capillary action sequentially through the reagent zones, and wherein the indicator reagent zone includes a reagent capable, directly or indirectly, of immobilising an enzyme-labelled reagent in an amount dependent on the assay result, characterized in that the absorbent material includes a reagent that prevents a signal formation except where enzyme-labelled reagent is immobilised at the indicator reagent zone. The absorbent material is suitably in the form of an elongate strip provided with transverse reagent zones. The device is useful for performing immunoassays, including immunometric assays and dual analyte assays.

US-CL-CURRENT: 435/7.9; 435/188, 435/7.93, 435/7.94, 436/164, 436/172, 436/528,

<http://westbrs:9000/bin/gate.exe?f=TOC&state=3pgbkl.7&ref=6&dbname=PGPB,USPT,US...> 10/14/04

ABSTRACT:

As method of determining an analyte is described, where a medium suspected of containing an analyte is drawn into a capillary tube by capillary action, such that if the analyte is present, it becomes immobilized in the tube. This medium is expelled from the tube and, optionally, one or more additional reagents are similarly drawn up and expelled. When the last fluid is expelled from the tube, a pendulous drop is caused to form at the opening of the capillary tube and is examined for the presence or intensity of the signal, which is related to the presence or amount of analyte in the medium.

TITLE: Method of calibration with photoactivatable chemiluminescent matrices

DATE-ISSUED: April 8, 1997

INVENTOR-INFORMATION:

NAME	CITY	STATE	ZIP CODE	COUNTRY
Pease; John S.	Los Altos	CA		
Kirakossian; Hrair	San Jose	CA		
Wagner; Daniel B.	Sunnyvale	CA		
Ullman; Edwin F.	Atherton	CA		

US-CL-CURRENT: 436/8; 436/172, 436/905

ABSTRACT:

Methods for labeling a material are disclosed. The methods comprise combining with the material (a) a photosensitizer capable upon irradiation of generating singlet oxygen and (b) a chemiluminescent compound capable of being activated by singlet oxygen wherein the photosensitizer and the chemiluminescent compound are incorporated in a particulate matrix or a non-particulate solid matrix. The particulate matrix can be solid or fluid. The methods allow for generating delayed luminescence, which can be realized upon irradiation of the matrix. The methods have application to the determination of an analyte in a medium suspected of containing the analyte. One method comprises subjecting a medium suspected of containing an analyte to conditions under which a complex of specific binding pair (sbp) members is formed in relation to the presence of the analyte and determining whether the sbp member complex has formed by employing as a label a single composition having both chemiluminescent and photosensitizer properties. Upon activation of the photosensitizer property singlet oxygen is generated and activates the chemiluminescent property. Compositions and kits are also disclosed.

546/18

ABSTRACT:

Methods are disclosed for determining an analyte in a medium suspected of containing the analyte. One method comprises providing (1) combining a medium suspected of containing the analyte and a novel chemiluminescent compound, (2) combining a means for chemically activating the chemiluminescent compound; and (3) detecting the amount of luminescence generated by the chemiluminescent compound. The amount of luminescence generated is related to the amount of analyte in the medium. The chemiluminescent compound can be chemically activated by hydrogen peroxide. Compositions and kits are also disclosed. The chemiluminescent compound is a spiro-acridan and has ##STR1## where X and Y are independently O, S, Se or NH; and Z is a chain, 1-5 atoms in length; 0 to 8 hydrogens of the compound alone or taken together, may be replaced an alkyl, alkylidene, aryl, aralkyl, or an alkyl, aryl or aralkyl substituted with one or more radicals of functional groups; 1 to 4 of the aromatic carbon atoms may be replaced by nitrogen atoms; and 0 to 1 hydrogens may be replaced by a specific binding pair member or fluorescent group.

Feola; Mario	Lubbock	TX		
Simoni; Jan S.	Lubbock	TX		
Canizaro, deceased; Peter C.	late of Lubbock	TX		

US-CL-CURRENT: 514/6; 514/832, 530/385, 530/829

ABSTRACT:

An improved blood substitute comprises purified hemoglobin, preferably bovine, cross-linked intramolecularly with periodate-oxidized ATP (o-ATP) and intermolecularly with periodate-oxidized adenosine (o-adenosine), combined with reduced glutathione (GSH), and optionally enriched with mannitol, non-electrolytes, and/or electrolytes. The blood substitute has prolonged intravascular persistence, can sustain plasma volume, has low oxygen affinity, can work as a physiological oxygen carrier, has vasodilator activity and can reduce the vasoconstriction that follows hemorrhage. A method of treating a human afflicted with acute blood loss and/or a sickling crisis of sickle cell anemia comprises intravenously administering to the human an effective volume of the blood substitute.

ABSTRACT:

The present invention relates to pharmaceutical compositions useful for the treatment of subjects suffering from an infection or disease caused by the hepatitis B virus (HBV). In particular, it has been discovered that the administration of low dosage amounts of 1-(2'-deoxy-2'-fluoro-.beta.-D-arabinofuranosyl)-5-iodouracil (FIAU) to humans chronically infected with HBV is effective to reduce drastically circulating markers associated with HBV. The present invention is also directed to methods of the preparation of pharmaceutical antiviral compositions.

ABSTRACT:

Methods are disclosed for determining an analyte in a medium suspected of containing the analyte. One method comprises providing (1) a medium suspected of containing the analyte, (2) a label reagent comprising a first specific binding pair (sbp) member associated with a photochemically activatable chemiluminescent compound wherein the first sbp member is capable of binding to the analyte or to a second sbp member to form a complex related to the presence of the analyte. The method further comprises photochemically activating the chemiluminescent compound. The amount of luminescence generated by the chemiluminescent compound is detected. The amount thereof is related to the amount of analyte in the medium. Compositions and kits are also disclosed.

436/533, 436/534, 436/801, 436/803, 436/817, 436/820, 436/827

ABSTRACT:

A method for obtaining an actual linear standard curve in a sandwich type of immunoassay where a first antibody bound to an insoluble support and a second unbound labelled antibody complex with the antigen contained in a test sample to form an insoluble antibody:antigen:labelled antibody complex which is then detected. Unbound unlabelled first antibody and/or unbound unlabelled second antibody are added to the reaction mixture to divert excess antigen away from the desired end-product complex, thus rendering the antigen of interest the rate-limiting factor in the overall immunoreaction. This results in a pseudo first-order reaction which produces an actual linear standard curve.

ABSTRACT:

Improved steps and methods for rapid, efficient and accurate assay of the CPK isozyme MB (cardiac fraction) and other determinations using chromatographic column technique. The improvements are especially adapted for carrying out rapid diagnostic tests in clinics and hospitals. Also contemplated improved apparatus and methods and uses of same adapted for the test method, such apparatus having novel features which can be packaged and merchandised in kit form. Other special features include use of electrophoresis either with or without the conventional chromatographic column analyses and using a selected colored (preferred-green) marker dye. Another special feature is that the used columns of the improved design can be conveniently recycled using the same solutions.

436/808

ABSTRACT:

A double antibody radioimmunoassay method for determining antigens in a sample wherein polyethylene glycol is provided in a reaction medium to accelerate an immunoprecipitation reaction between water-soluble first antibodies bound to antigen and water-soluble second antibodies which are not specific to said antigens but which are specific to said first antibodies. A double antibody, multi-component radioimmunoassay test kit is also provided. The kit contains radiolabeled antigen reagent, first water-soluble antibody reagent and second water-soluble antibody reagent, as well as a polyethylene glycol reagent, which may optionally be combined with the second antibody reagent, in an amount sufficient to accelerate an immunoprecipitation reaction, between said first and second reagents.

ABSTRACT:

<http://westbrs:9000/bin/gate.exe?f=TOC&state=3pgbkl.7&ref=6&dbname=PGPB,USPT,US...> 10/14/04

A method and reagent for counteracting lipemic interference in an assay of a lipid-containing sample, e.g. blood. The method includes the steps of: (a) mixing with the sample prior to or during said assay a high surface area, finely-divided adsorbent having an affinity for lipids, and a nonionic, water-soluble polymer, and (b) precipitating adsorbed lipids in said sample. The reagent includes a high surface area finely-divided adsorbent, and a nonionic, water-soluble polymer having a molecular weight of from about 1,000 to 100,000.

134/29, 134/3

ABSTRACT:

A systematic and programmed wash cycle for cleaning automatic and semi-automatic biochemical analyzers and separators and other equipment. The wash cycle includes a series or sequence of specific and ordered washing steps using a fixed specific sequence of reagents in critical concentrations including use of a hypochlorite reducing agent, a peroxide oxidising agent, an alkaline hydroxide solution, a solution of cetyl pyridinium bromide and cinnamic aldehyde, a solution of a polysulfonated alkyl detergent and a hydrochloric acid solution. It is also contemplated as a special feature, to use a so-called "polishing" system to eliminate from analyzers the micro-organisms and enzymes which cause interference with UV analyses. It is also a particular feature that the ordered wash cycle can be used to clean tubular flow systems, including piping and plumbing, such as may occur in centralized air conditioning units and miscellaneous washing machinery.

ABSTRACT:

LDH.sub.1 levels in serum samples can be rapidly and accurately assayed by a novel immunochemical technique. In such procedure the serum sample is treated with soluble antibodies against the M subunit and the resulting antigen-antibody reaction product is insolubilized with a second antibody supported on an insoluble material. The resulting supernatant containing only LDH, isoenzyme is assayed for enzymatic activity by conventional procedures. The assay of LDH.sub.1 levels in sera is useful in determining whether the subject has undergone a myocardial infarction.

US-CL-CURRENT: 435/17; 435/194

ABSTRACT:

A process for the determination of creatine phosphokinase MB-isoenzyme (CPK-MB) level in serum in which CPK is determined before and after MB-activation with 1,4-dimercapto-2,3-dihydroxy butane or 2-mercaptoethanol, preferably in an assay system using the ATP/ADP conversion. The difference in the two values found is due to the CPK-MB present. The invention is of particular utility in the diagnosis and treatment of myocardial damage.

BASIC-ABSTRACT:

NOVELTY - The method deals with earlier diagnostics of infectious-toxic cardiopathy after purulent-septic diseases in neonatals and babies at simultaneous evaluation of the state in metabolic and energetic processes in myocardium. Simultaneously detect the activity of creatine phosphokinase in venous blood serum, succinate dehydrogenase, and alpha-glycerophosphate dehydrogenase in capillary blood lymphocytes during restoration of purulent-septic process.

DETAILED DESCRIPTION - The method deals with earlier diagnostics of infectious-toxic cardiopathy after purulent-septic diseases in neonatals and babies at simultaneous evaluation of the state in metabolic and energetic processes in myocardium. One should simultaneously detect the activity of creatine phosphokinase - MB (CPKMB) in

venous blood serum, succinate dehydrogenase (SDG), alpha-glycerophosphate dehydrogenase (alpha- GPDG) in capillary blood lymphocytes during restoration of purulent-septic process and at higher CPK-MB activity value ranged 9.0-16 U/l and lower SDG value ranged 7.6- 5.2 g/lymph., alpha-GPDG value ranged 6.5-4.8 g/lymph. One should diagnose infectious-toxic cardiopathy.

USE - The method deals with earlier diagnostics of infectious-toxic cardiopathy after purulent-septic diseases in neonatals and babies.

ABSTRACTED-PUB-NO: CN 1363839A

BASIC-ABSTRACT:

NOVELTY - The invention discloses a biological chip for diagnosing early myocardial infarction. The main features of the invention are that the biological chip for diagnosing early myocardial infarction is composed of carrier box and piece of test paper of protein, and there are more than three (including three) carrier slots in the back board of the carrier box. Pieces of test paper with multiple indicators at least including for testing muscle hemoglobin, troponin I, or troponin T and serous creatine phosphate kinase isoenzyme (CPK-MB) are put into the carrier slots, moreover pieces of test paper prepared for other protein singularity antibody can be added also. The biological chip overcomes shortcomings of complex testing process, long period and expensive that existing prior art. The invention can be used for people to test by himself or in hospital.

ABSTRACTED-PUB-NO: US20020058612A

BASIC-ABSTRACT:

NOVELTY - Treatment of heart disease comprising multi-tiered administration of growth factors.

DETAILED DESCRIPTION - Systematic multi-tiered treatment of heart disease comprises delivery of therapeutic growth factor proteins (GFP) by:

- (a) oral inhalation of at least one dose of an effective amount of a first therapeutic GFP formulation in a patient displaying symptoms of heart disease;
- (b) monitoring levels of CPK-MB in the patient;
- (c) determining whether administration of the GFP formulation was effective in treating the symptoms;
- (d) administering one or more additional doses of a second GFP formulation by a delivery method more invasive than oral inhalation; and
- (e) repeating steps (b)-(d) until there is a clinical indication of amelioration of the symptoms of heart disease in the patient, or until there is a contraindication to continued treatment.

INDEPENDENT CLAIMS are also included for the following:

- (1) administration of therapeutic amounts of GFP formulation for treatment of heart disease by inhalation;
- (2) monitoring clinical effectiveness of administration of a GFP formulation in the treatment of heart disease comprising:
 - (i) performing an assay on a sample of biological fluid from a patient displaying symptoms of heart disease to determine the amount of CPK-MB present in the fluid;
 - (ii) administering a therapeutic amount of GFP formulation to the patient; and
 - (iii) repeating steps (i) and (ii) until the assayed amount of CPK-MB in the biological fluid has decreased by an amount sufficient to indicate the clinical

effectiveness of the administration of the GFP formulation.

ACTIVITY - Cardiant. Pellets containing 10 or 100 micro g basic fibroblast growth factor (bFGF) or placebo were placed on the epicardial surface in patients with a viable and ischemic myocardial area that could not be revascularized, during coronary artery bypass surgery. After 16 months patients were angina free with the exception of 3 people in the placebo group and 1 patient who received the 10 micro g pellet.

MECHANISM OF ACTION - Angiogenesis stimulator.

USE - The method is used for the treatment of heart disease, where the symptoms are chronic or acute, especially where the symptoms are brought on by myocardial infarction, unstable angina, acute anginal attack or reperfusion injury, preferably induced by thrombolytic therapy, bypass surgery or angioplasty (claimed).

ADVANTAGE - Inhalation is the least invasive method of delivering the growth factors to the lungs. Prior are invasive approaches have not been successful in promoting angiogenesis. The pericardial space serves as a drug delivery reservoir for delivery of therapeutic agents to the heart. Use of a catheter avoids the need for open chest surgery. Intravenous infusions are practical, low cost and can be used in a broad group of patients. Treatment can be repeated easily and may not require any special facilities.

EP 467695 A	January 22, 1992		000	
EP 467695 A3	August 5, 1992		000	

INT-CL (IPC): A61N 1/36

ABSTRACTED-PUB-NO: EP 467695A

BASIC-ABSTRACT:

The appts. has electrocardiographic sensor for electrical activity in the heart esp. R-wave amplitude and ST segment voltage level and a device for recognising an MI, thus initiating the supply of a thrombolytic drug (and possibly antiarrhythmic agents, nitrates or other cardiovascular drugs) to the patient's bloodstream. Sensing and appropriate corrective therapy for fibrillation of the heart, tachycardia and brachycardia is provided as optional provisions.

The electrical sensor may be supplemented with additional sensors to monitor the mechanical activity of the heart esp. heart wall motion and blood pressure, blood concentrations of selected ions esp. potassium and selected serum enzymes esp. CPK-

MB.

ADVANTAGE - Detects MI at onset using objective methods which do not rely on patient's chest pain.

US-CL-CURRENT: 514/171; 514/423

ABSTRACT:

Combinations of an ACE inhibitor and an epoxy-steroidal aldosterone receptor antagonist are described for use in treatment of circulatory disorders. Of particular interest are therapies using epoxy-steroidal-type aldosterone receptor antagonist compounds, such as eplerenone, in combination with an angiotensin converting enzyme inhibitor. This co-therapy would be particularly useful to treat congestive heart failure while avoiding or reducing aldosterone-antagonist-induced side effects such as hyperkalemia.

ABSTRACT:

Marker compounds indicative of variations in physiological conditions, genetic defects or disease states have been found to be present in apocrine sweat and, in many conditions, these markers are present in apocrine sweat in elevated levels when compared to blood. These markers are collected and/or detected in apocrine sweat and used as an indicator that a disease state or particular physiological condition exists. A skin patch, wipe or other collection means is used to collect apocrine sweat. The apocrine sweat is then used to indicate the existence of a disease state or changing physiological condition by the presence of specific marker compounds.

Apocrine sweat can also be collected from individuals known to have a specific disease or physiological condition and, by comparison with apocrine sweat from normal individuals, used to identify new markers indicative of the specific disease state or physiological condition.

ABSTRACT:

Marker compounds indicative of variations in physiological conditions, genetic defects or disease states have been found to be present in apocrine sweat and, in many conditions, these markers are present in apocrine sweat in elevated levels when compared to blood. These markers are collected and/or detected in apocrine sweat and used as an indicator that a disease state or particular physiological condition exists. A skin patch, wipe or electronic detector for vapors released from apocrine sweat are used to indicate the existence of a disease state or changing physiological condition. The patch or wipe can include in monoclonal antibodies or other chemical compounds that can indicate the presence of specific markers. This may include indicators that render visible, the existence of a reaction between the monoclonal antibody or chemical compound and the marker compound to indicate the existence of the condition being tested for. Various different disease states can be detected including, but not limited to heart disease, cancer, autoimmune disease, viral or bacterial disease, renal disease, drug intoxication and other systemic illnesses. Fertility for conception and histocompatibility for organ transplantation of individuals should also be detectable.

ABSTRACT:

Disclosed herein is a rational, multi-tier approach to the administration of growth factor proteins in the treatment of heart disease. Also disclosed is a method to evaluate the effectiveness of the administration of growth factor proteins comprising the clinical assay of CPK-MB levels in a patient undergoing treatment with growth factor proteins. In addition, there is disclosed a method for treatment of heart disease comprising administration of a therapeutically effective amount of a growth factor protein by oral inhalation therapy.

ABSTRACT:

Marker compounds indicative of variations in physiological conditions, genetic defects or disease states have been found to be present in apocrine sweat and, in many conditions, these markers are present in apocrine sweat in elevated levels when compared to blood. These markers are collected and/or detected in apocrine sweat and used as an indicator that a disease state or particular physiological condition exists. A skin patch, wipe or electronic detector for vapors released from apocrine sweat are used to indicate the existence of a disease state or changing physiological condition. The patch or wipe can include in monoclonal antibodies or other chemical compounds that can indicate the presence of specific markers. This may include indicators that render visible, the existence of a reaction between the monoclonal antibody or chemical compound and the marker compound to indicate the existence of the condition being tested for. Various different disease states can be detected including, but not limited to heart disease, cancer, autoimmune disease, viral or bacterial disease, renal disease, drug intoxication and other systemic illnesses. Fertility for conception and histocompatibility for organ transplantation of individuals should also be detectable.

ABSTRACT:

Methods of preventing tissue damage associated with decreased blood flow in a human by administering AICA riboside or a prodrug thereof in an amount which provides a blood plasma concentration of between 1 .mu.g/ml and 20 .mu.g/ml of AICA riboside for a time sufficient to reduce the risk of said tissue damage in said human. Methods of preventing an adverse clinical outcome, such as an adverse cardiovascular and/or cerebrovascular event, in a patient at risk for such outcome by administering AICA riboside or a prodrug thereof in an amount which provides a blood plasma concentration of between 1 .mu.g/ml and 20 .mu.g/ml of AICA riboside for a time sufficient to reduce the risk for said patient.

ABSTRACT:

Improved steps and methods for rapid, efficient and accurate assay of the CPK isozyme MB (cardiac fraction) and other determinations using chromatographic column technique. The improvements are especially adapted for carrying out rapid diagnostic tests in clinics and hospitals. Also contemplated improved apparatus and methods and uses of same adapted for the test method, such apparatus having novel features which can be packaged and merchandised in kit form. Other special features include use of electrophoresis either with or without the conventional chromatographic column analyses and using a selected colored (preferred-green) marker dye. Another special feature is that the used columns of the improved design can be conveniently recycled using the same solutions.

The significance of the MB isoenzyme in patients with acute cardiovascular disease with a normal or borderline total CPK activity.

D'Souza JP, Sine HE, Horvitz RA, Kubasik NP, Brody BB, Barold SS.

CPK MB isoenzymes were qualitatively identified using an electrophoresis method in 166 patients with acute cardiovascular disease during a six month period. Forty-three had total CPK activity in the normal or borderline range (0- U/Liter at the time the MB isoenzyme was first identified. Fifteen of these patients were diagnosed as having had a new acute myocardial infarction (Group I) or another 15 as having had an old myocardial infarction (Group II). Diagnosis was based on electrocardiographic changes or autopsy findings. The remaining 13 patients were classified as "ischemic heart disease" (Group III) in the absence of strict electrocardiographic criteria or autopsy evidence of myocardial infarction. Nine of the 15 patients in Group I subsequently had elevations of their total CPK activity above 75 U/L. In contrast the total CPK activity of only one patient from Group II and Group III subsequently exceeded 75 U/liter. All 43 patients had evidence of cardiovascular disease. Our findings suggest that the detection of MB isoenzyme in the presence of a normal total CPK activity is a significant laboratory finding and is indicative of cardiac myofiber injury.

[Experimental and clinical assessment of myocardial protective effect of a prostacyclin analogue (OP 41483)]

[Article in Japanese]

Kuki S, Matsuda H, Sawa Y, Ohtani M, Sasako Y, Ohtake S, Takami H, Kuratani T, Nakano S, Kawashima Y.

The beneficial effects of a stable prostacyclin analogue (PGI2-A), OP 41483 against myocardial ischemic injury were experimentally and clinically evaluated. In 31P-NMR study, the preischemic treatment with PGI2-A prevented myocardial ATP depletion of rat hearts which were subjected to 20 min global ischemia. In patients with congenital heart disease, the PGI2-A of 300 ng/ml was added to 1 glucose-insulin-potassium cardioplegia (PGI2-group), and this group was compared to control group without PGI2-A in terms of postoperative maximal leakage of CPK-MB (maxCPK-MB). In patients under 1 yr or patients over 1 yr with aortic cross clamp time exceeded 120 min, the maxCPK-MB was significantly ($p < 0.05$) reduced as compared to the control. This stable PGI2 analogue has shown significant myocardial protective effects experimentally as also in clinical setting.

Cellulose acetate electrophoresis of creatine phosphokinase isoenzymes in the diagnosis of myocardial infarction.

Wong R, Swallen TO.

A method for rapid separation and visualization of creatine phosphokinase (EC 2.7.3.2 ATP: creatine phosphotransferase) isoenzymes on cellulose acetate has been developed. The technic uses the Beckman microzone electrophoresis syst and is applicable to other cellulose acetate systems. Incubation is with a commercially available substrate solution, and the isoenzyme bands are visuali by fluorescence using a long-wavelength ultraviolet light. An intermediate migrating isoenzyme band (CPK-MB) was detected in sera of 67 of 68 patient with myocardial infarction, and was not present in patients with other disorder that might clinically be confused with myocardial infarction.

Diagnosis, incidence, and clinical significance of early postoperative ischemia after transmyocardial laser revascularization.

Hughes GC, Landolfo KP, Lowe JE, Coleman RB, Donovan CL.

Duke University Medical Center, Durham, NC 27710, USA.

BACKGROUND: Clinical improvement after transmyocardial laser revascularization (TMR) is typically delayed, and patients therefore remain at risk for ischemic events after the procedure. The purpose of this study was to define the range of creatine phosphokinase (CPK) and CPK-MB enzyme elevation after TMR and to assess the incidence of early postoperative ischemic events. **METHODS:** Twenty-one patients undergoing isolated TMR were evaluated for 48 hours after surgery with serial CPK and CPK-MB enzymes and 12-lead electrocardiograms for evidence of myocardial ischemia or injury. Clinically evident postoperative ischemic events including angina pectoris, myocardial infarction (MI), and cardiac death were recorded as well. **RESULTS:** Eleven patients (52.4%) had ischemic electrocardiographic changes in the first 48 hours after TMR. Ischemia was clinically silent in 7 (63.6%) of these 11 patients. Cardiac death occurred in 1 patient (4.8%) as a result of acute MI. Nonfatal MI occurred in an additional 4 patients (19.0%). Of the 5 patients with MI, 4 had angina pectoris versus no angina in the 16 patients without MI ($P = .02$). All patients had elevated CPK and CPK-MB levels after TMR; however, peak CPK ($P = .02$) and CPK-MB ($P = .005$) levels were significantly higher for patients suffering postoperative MI compared with those without MI. **CONCLUSIONS:** Transient ischemia occurs frequently after TMR and is clinically silent in the majority of patients. Patients with postoperative MI are more likely to have symptomatic ischemia as well as significant cardiac enzyme elevation. The combination of 12-lead electrocardiogram and cardiac enzymes appears to have significant merit for the diagnosis of myocardial ischemia and infarction after TMR. These studies should be obtained in all patients undergoing TMR for the first 48 hours after surgery.

Myoglobin, creatine kinase-B isoenzyme, and myosin light chain release in patients with unstable angina pectoris.

Hoberg E, Katus HA, Diederich KW, Kubler W.

Abteilung Innere Medizin III (Kardiologie), University of Heidelberg, F.R.G.

In 27 patients presenting with angina pectoris at rest and normal serum creatine kinase (CK) activity, cardiac myosin light chains (CM-LC), myoglobin (MG), CK-B isoenzyme were determined in 7 serial blood samples by radioimmunoassays. Measurable amounts of CM-LC were found in at least one serum sample in 13 patients. MG was found to be elevated in 9, and CK-B in 8 of these patients. In the 189 serum samples determined, CM-LC were found more frequently elevated (21.7%) than MG (13.2%, P less than 0.05) or CK-B (12.2% less than 0.05). Coronary angiograms were obtained in 21 of the 27 patients. Elevated marker protein concentrations were found only in patients with coronary artery stenosis greater than or equal to 70% of at least one coronary artery. The incidence of elevated serum concentrations of any of the 3 marker proteins determined was higher in patients with 3 vessel disease than in those with 1 or 2 vessel disease (33.9% vs 15.6%, P less than 0.05), and it was higher in patients with a history of previous myocardial infarction than in those without (34.5% vs 11.4%, P less than 0.001). The findings suggest that in a subgroup of patients with angina pectoris at rest but without evidence of acute myocardial infarction, ischaemic damage of small myocardial areas can be detected by serological assays of high sensitivity. Among the marker proteins studied, CM-LC were found to be the most sensitive.

Semi-automated direct colorimetric measurement of creatine kinase isoenzyme MB activity after extraction from serum by use of a CK-MB-specific monoclonal antibody.

Landt Y, Vaidya HC, Porter SE, Whalen K, McClellan A, Amyx C, Parvii CA, Kessler G, Nahm MH, Dietzler DN.

Department of Pathology, Washington University School of Medicine, St. Louis MO 63110.

This semi-automated colorimetric assay for the MB isoenzyme of creatine kinase (EC 2.7.3.2) is based on a monoclonal antibody ("Conan-MB") specific for this isoenzyme and is a modification of a previously published method (Vaidya et al; Clin Chem 1986;32:657-63). A 0.64-cm bead coated with 2 to 3 micrograms of antibody is incubated with 100 microL of serum and 10 microL of 0.2 mol/L beta-mercaptoethanol for 1 h at room temperature, to extract CK-MB. The beads are washed with de-ionized water and incubated with CK substrate for 45 min at 37 degrees C. A solution containing trans-1,2-diaminocyclohexane-N,N,N',N'-tetraacetic acid, p-iodonitrotetrazolium violet, and diaphorase is added and the resulting colored product is measured at 492 nm. The standard curve is linear to 200 U of CK-MB per liter, and analytical recovery is 97-113%. Total assay CV at low (9.7 U/L) and high (50.7 U/L) quality-control materials was 14.1% (n = 18) and 11.6% (n = 1842), respectively. CK-MB activity correlated well (r = 0.978, n = 226) with CK-MB measured by a two-site mass immunoassay, and 99.4% of samples with CK-MB greater than or equal to 12 U/L (n = 347) were verified by electrophoresis on agarose.

The effect of established beta-adrenoreceptor-blocking therapy on the release of cytosolic and lysosomal enzymes after acute myocardial infarction in man.

Welman E, Fox KM, Selwyn AP, Carroll BJ.

1. Serial venous blood samples were obtained from 45 patients with acute myocardial infarction. Ten of these patients were receiving beta-adreno-receptor blocking drugs at the time of onset of chest pain and continued on these drugs during their stay in the coronary care unit. The activities of creatine kinase and MB-isoenzyme (CK-MB) were assayed in the plasma. A lysosomal enzyme, b N-acetylglucosaminidase, was also assayed. 2. In the 35 untreated patients it was found that creatine kinase activity was maximal at a mean time of 21.3 +/- 1.3 after the onset of chest pain, whereas in the patients receiving beta-adrenoreceptor blocking drugs peak activity of the enzyme occurred at 24.4 +/- 0.7 h. 3. Peak MB activity was also delayed from 18.1 +/- 1.6 h in the control group to 22.4 +/- 1.2 h in the treated patients. 4. The lysosomal enzyme showed a similar pattern of changes to that of CK-MB. Maximum activity in plasma occurred at 18.0 +/- 1.2 after the onset of chest pain in the control group of patients. In the treated patients peak lysosomal enzyme activity was not found until 24.2 +/- 1.2 h. 5. These alterations in the time-course of plasma enzyme changes after acute myocardial infarction are consistent with the suggestion that beta-receptor antagonists may delay tissue damage during myocardial ischaemia.

Treatment of acute myocardial infarction with sodium nitropruss during 24 hours, followed by isosorbide dinitrate.

Durrer JD, Lie KI, van Capelle FJ.

In a controlled randomized study of 328 consecutive patients admitted within 12 hours after the onset of acute myocardial infarction, 163 patients received a sodium nitroprusside infusion during 24 hours, followed by six times a day 5 mg isosorbide dinitrate for seven days and 165 patients received a glucose 5% infusion. Excluded from the study were patients with either pulmonary edema and/or cardiogenic shock, two or more previous myocardial infarctions or a systolic blood pressure of less than 95 mmHg just before entering the study. Sodium nitroprusside was titrated in such a way that systolic blood pressure was kept between 95 and 105 mmHg. Standard medical treatment for both groups was the same. CK-MB was sampled every four hours until peak value was reached. Endpoint of the study was a significant reduction in mortality within a week after starting treatment.

Comparison of different pharmacological interventions on enzym parameters during acute myocardial infarction.

Vassanelli C, Menegatti G, Nidasio GP, Franceschini L, Cocco C, Rizzotti

Dipartimento di Cardiologia, Universita di Verona, Italia.

The concept that acute myocardial infarction is a dynamic event and that different interventions can modify the extent of the necrosis, has led to renewed interest in early pharmacological and surgical treatments designed to reduce the ischemic injury. To evaluate the effects of different pharmacological interventions aimed to reduce the extent of necrosis, we studied 166 patients (138 male and 28 female; mean age of 59.4 +/- 11.3 years) admitted within 6 h after chest pain and treated with a single therapy during the first 72 h. Enzymatic infarct size (IS) was calculated by serial creatine kinase isoenzyme MB determinations using a compartmental model. Six groups of patients were evaluated: 33 patients were treated only with antiplatelet drugs, 38 with anticoagulants, 34 with intravenous thrombolytic therapy, 20 with calcium channel blockers, 25 with nitrates, and 25 with beta-blockers. Estimated IS (gEq/m2) and elimination constant (Kd, U/L/h) did not differ in the six groups, but patients treated with streptokinase had high release constant (Ka, U/L/h) and shorter time to peak CK-MB value. Early treatment (less than or equal to 2 h after chest pain) had a favourable effect on enzymatic IS only in patients treated with calcium channel blockers (p less than 0.005).

ECG and enzymatic indicators of therapeutic success after intravenous streptokinase for acute myocardial infarction.

Clemmensen P, Grande P, Pedersen F, Granborg J, Svendsen JH, Madse JK, Haedersdal C, Saunamaki K.

Department of Medicine B, Rigshospitalet, Copenhagen, Denmark.

Thrombolytic therapy has been documented to result in reperfusion of jeopardized myocardium and reduction in the size of the acute myocardial infarction (AMI). The effect of intravenous streptokinase on a creatine kinase-MB (CK-MB) reperfusion index and an ECG estimate of myocardial salvage was therefore studied in 65 patients with a first AMI, randomized to treatment with streptokinase (n = 33) or placebo (control group, n = 32). Reperfusion was defined as a CK-MB appearance rate constant (k1) greater than 0.185. The final AMI size was first predicted from the admission standard ECG by previously developed formulas based on ST segment elevation. The final AMI size was estimated from the QI score on the predischARGE ECG. Myocardial salvage was defined as a greater than or equal to 20% decrease from predicted to final AMI size. The k1 value in the control group was significantly lower than that in the streptokinase group (mean 0.157 versus 0.328; p = 0.0001). Accordingly the reperfusion rate was higher in the streptokinase group than in the control group (88% versus 34%; p = 0.0002). The difference in AMI size (final-predicted) was significantly greater in the streptokinase group than in the control group (median -7% versus +1%; p = 0.0001). Myocardial salvage occurred in 60% and 19%, respectively (p = 0.0001). A significant correlation was found between CK-MB reperfusion and ECG salvage: 19 of 20 streptokinase-treated patients with salvage also had reperfusion. (ABSTRACT TRUNCATED AT 250 WORDS)

The effect of intravenous nitroglycerin therapy on infarct size in patients with acute myocardial infarction.

Raos V, Jeren-Strujic B, Ljutic D, Horvatin-Godler S, Straus B.

New Hospital, Zagreb, Croatia.

The authors investigated the influence of glyceryl-trinitrate (NTG) given intravenously to the reduction of infarction size in 95 patients (71 men and 24 women) aged 36 to 75, with acute myocardial infarction (AIM) admitted to the Intensive Care Unit within six hours of the onset of pain. Infarction mass was calculated by mathematical model from the serial changes of CK and CK MB serum activities during 72 hours and expressed in CK and CK MB gEq. CK and CK MB were determined every four hours. The patients were divided into four groups according to the therapy they were receiving: I--NTG i.v. (n = 29); II S NTG i.v. (n = 29); III SK i.v. (n = 17) and IV ISDN per os (n = 20). Each group was divided into subgroups regarding the time interval from the onset of pain to the beginning of the therapy (within three hours and after three hours). Application of NTG i.v. in the early phase of AIM, 0-3 hours from the onset of pain, led to significant reduction of infarction mass CK gEq and CK MB gEq (0-3 hours; middle rank = 11.35; 3-6 hours: middle rank = 17.7) ($P < 0.05$) and 0-3 hours; middle rank = 10.31; 3-6 hours: middle rank = 18.81 ($P < 0.01$). It was established that the "timing" factor was very important in the preservation of myocardial mass in AIM. It affirms the efficacy of NTG i.v., i.e., its direct effects on the coronary arteries and systemic effects that cause salvation of the myocardium. The influence of NTG iv to myocardial infarction size CK gEq did not depend on ECG localization. But it influenced the ECG localization when the infarction size was calculated from CK MB isoenzyme and expressed in CK MB gEq. Infarction size CK MB gEq was statistically significantly smaller in the inferior than in the anterior localization ($P < 0.05$).

Effect of therapeutic interventions on CK and CK MB serum acti kinetics during acute myocardial infarct.

Raos V, Jeren-Strujic B, Horvatin-Godler S, Ljutic D, Straus B.

Department of Medicine, Dubrava University Hospital, Zagreb, Croatia.

Determination of serum creatine kinase (CK) activity, especially the CK MB, isoenzyme is becoming the main diagnostic criterion for acute myocardial infarction (AMI). The aim of this study was to assess the kinetics of the release CK and CK MB in AMI patients on various therapeutic regimens. The study included 75 AMI patients (within 6 hours from the pain onset). They were divided into three groups according to therapy: 1. NTG i.v. (glyceryl trinitrate, N=29), 2. SK + NTG i.v. (streptokinases + glyceryl trinitrate, N = 29); and 3. SK i.v. (N = 17). Samples CK and CK MB determination were taken every 4 hours in the course of 72 hours until serum enzyme values returned to normal. The time interval between the introduction of therapy and CK and CK MB peak values expressed in ranks was the shortest in group 3 and longest in group 1. The difference in maximal CK release in to peripheral blood ($\chi^2 = 9.5270$, $p = 0.0180$) was statistically significant, while difference in CK MB was not ($\chi^2 = 2.2733$, $p = 0.2875$) (Kruskal Wallis one way test). Comparing CK release time the CK MB within each group by means of ranks, statistical significance in favour of CK MB (1. NTG i.v. $p = 0.0000$, 2. SK + NTG $p = 0.0001$, 3. SK $p = 0.0180$) was obtained. The rate of CK and CK MB elimination from the circulation, expressed as fractional level of losing k_d , did not statistically differ in the three groups. Our results showed the therapeutic procedures used in the treatment of AMI patients differently influence the CK and CK MB kinetics. Thrombolytic therapy changes the CK and CK MB kinetics, due to reperfusion and explained by the washout phenomenon from the infarcted zone of the myocardium.

Creatine kinase MB during myocardial infarction: relationship to preexisting coronary heart disease and medication.

Sax H, Contesse J, Dubach P, Reinhart WH.

Kantonsspital, Chur, Switzerland.

Creatine kinase (CK) and its isoenzyme CK-MB are important tools for the diagnosis of acute myocardial infarction. The content of CK-MB relative to total CK in myocardial cells is variable; it is low in normal myocardium and increases several-fold in hypoxic myocardium. We tested the hypothesis that CK-MB m (CK-MBm) could be related to cardiovascular history, preinfarctional medication and clinical course during myocardial infarction. In a prospective study CK and CK-MBm were measured 0, 6, 12, 18, 24, 36, 48 and 72 h after the admission to the coronary care unit. Peak values and areas under the curve (AUC) were determined and normalized for total CK activity (CK-MBm/CK). Of 185 patients with acute chest pain, 70 patients had 71 acute myocardial infarctions and were enrolled in the study. A history of chronic angina pectoris or hypertension had influence on CK-MBm/CK levels. In contrast, treatment with beta-blockers before infarction resulted in a lower relative CK-MBm peak value (CK-MBm/CK 6.0 (median value), range 3.1-15.3, versus 7.0, range 0.5-17.3; $p < 0.05$). Other drugs had no influence. Patients with persistent pain on admission tended to have higher relative CK-MBm values (peak CK-MBm/CK: 6.8, range 0.5-17.3, versus 5.3, range 1.4-7.9, $p = 0.08$; AUC CK-MBm/CK: 0.05, range 0.01-0.10, versus 0.03, range 0.01-0.06, $p < 0.05$). Three vessel disease on coronary angiography was associated with higher peak CK-MBm/CK values during the acute phase of myocardial infarction than those with 1-2 vessel disease (Peak CK-MBm/CK: range 5.5-17.3, versus 6.4, range 3.1-10.2, $p < 0.05$; AUC CK-MBm/CK: 0.06, range 0.02-0.11, versus 0.04, range 0.02-0.07, $p < 0.05$). We conclude that relative CK-MBm/CK levels reflect to a certain degree the extent of the coronary disease and that preinfarctional beta-blockade may result in lower CK-MBm levels.

Hepatocyte growth factor(HGF): a new biochemical marker for acute myocardial infarction.

Sato T, Yoshinouchi T, Sakamoto T, Fujieda H, Murao S, Sato H, Kobaya H, Ohe T.

Department of Cardiovascular Medicine, Matsuyama Shimin Hospital, Matsuy City, Ehime, Japan.

The purpose of this study was to investigate the use of hepatocyte growth factor as a biochemical marker for acute myocardial infarction. Several biochemical markers are used for noninvasive detection of acute myocardial infarction. However, hepatocyte growth factor has not been used previously for this purpose. We measured hepatocyte growth factor, creatine phosphokinase, and MB isoenzyme (CK-MB) levels in 6 patients with stable effort angina after diagnostic catheterization (controls) and in 12 patients with acute myocardial infarction (AMI). The measurements in the AMI patients were recorded twice a day for the first 3 days after onset of chest pain and once a day for the next 4 days. Furthermore, in each patient we evaluated the time to reach the maximum level and the time for the level to decline to less than half the maximum. Hepatocyte growth factor levels (ng/ml) were 0.3 ± 0.1 for angina pectoris patients, and 15.7 ± 9.1 within 6h and 12.5 ± 4.6 within 12h after the onset for AMI patients respectively. The correlation coefficients between hepatocyte growth factor and creatine phosphokinase and between hepatocyte growth factor and CK-MB were 0.68 and 0.74, respectively. The time to reach the maximum (h) and the time to decline to less than half of the maximum level (days) were 6.6 ± 2.6 and 1.2 ± 0.4 for hepatocyte growth factor, 19.4 ± 8.7 and 2.5 ± 1.4 for creatine phosphokinase and 16.6 ± 7.7 and 1.5 ± 0.4 for CK-MB, respectively. Hepatocyte growth factor is useful as a prognostic indicator and reflects the clinical course in patients with acute myocardial infarction.

Biochemical markers of cardiac damage: from traditional enzymes to cardiac-specific proteins. IFCC Subcommittee on Standardization of Cardiac Markers (S-SCM).

Wu AH.

Department of Pathology, Hartford Hospital, CT 06102, USA. awu@harthosp.

Measurement of cardiac markers in blood has been the mainstay for diagnosis acute myocardial infarction for nearly 50 years. The field has evolved from measurement of enzyme activity to mass concentrations of proteins using automated non-isotopic immunoassays. With changing clinical practices, cardiac markers are now needed to detect the presence of minor myocardial infarction patients with unstable angina. Outcome studies have shown that patients with increased troponin are at high short-term risk for death and AMI. Recent developments involve the use of cardiac markers to select the most appropriate therapy for patients with acute coronary syndromes. The success of new cardiac markers such as troponin is due to their high cardiac specificity and the existence of assays with low detection limits. Traditional enzymes such as CK and CK-MB are thought to be released only in situations of irreversible myocardial necrosis; in the case of cardiac troponin, clinical observations and animal studies suggest that cytosolic free troponin may be released in reversible ischemia in addition to irreversible cell damage. The IFCC S-SCM has recommended use of two cut-off concentrations for cardiac troponin to differentiate normal from minor myocardial injury and AMI. A low cut-off may detect reversible ischemic events in some cases.

[Usefulness of creatine phosphokinase isoenzyme, CK-MB, in the diagnosis of myocardial necrosis (author's transl)]

[Article in Spanish]

Fiol Sala M, Fuentespina Vidal E, Abizanda Campos R, Ibanez Juve J, M Milla P, Abadal Centellas JM, Coll Solivellas R, Perello J, Garcia Moris S

With the objective of evaluating the clinical usefulness of a new immunologic method (Merck-1-Test CK-MB), in the determination of the CK-MB activity, patients admitted to the Coronary Unit for angina pectoris were studied. Samples of blood were gathered upon admission and every 4 hours for 48-72 hours, determining in each one of them the total CPK, SGOT, LDH, and CK-MB; electrocardiograms (ECG) were taken and all possible causes for the increase in the enzymatic activity were recorded. Results were analyzed in order to study the following aspects: in the patients in which an acute myocardial infarction was diagnosed the CK-MB activity was studied, also the relation of CK-MB to the remaining parameters, each parameter's sensitivity and specificity and the relationship of the CK-MB to the prognosis of the patients. The usefulness of CK-MB in the differential diagnosis of myocardial necrosis and variations in the total CKP curve in the clinical course of acute myocardial infarction unrelated to myocardial necrosis were evaluated too. The following conclusions were drawn from the analysis of the data. The immunological method has the advantages of sensitivity and easily and quickly performance (15 minutes), but it has the disadvantage that it detects CK-BB (elevated in cerebrovascular disorders). Two four hours after the onset of symptoms, the negativity of CK-MB does not exclude the diagnosis of a myocardial necrosis. CK-MB is more sensitive than total CPK diagnosing the extent of the area of necrosis. CK-MB is very specific for myocardial necrosis but less sensitive than other parameters. A positive CK-MB upon the patient's admission confirmed the diagnosis of necrosis in 60 percent of the cases, but in 18 percent error was induced because of false positives. CK-MB permitted confirmations of the diagnosis of myocardial infarction in 33 percent of the cases in which there was only a suggestion of necrosis by the ECG. The variation in the curve of total CPK in the course of an acute myocardial infarction is subjected to such a great number of factors intercurrent with time, that caution should be exercised in trying to relate a specific elevation of total CPK to an unsuccessful maneuver or to a possible extension of the area of necrosis.

☐ **1:** Canos DA, Mintz GS, Berzinger CO, Apple S, Kotani J, Pichard AD, Satler LF, Suddath WO, Waksman R, Lindsay J Jr, Weissman NJ. Related Articles

Clinical, angiographic, and intravascular ultrasound characteristics of early saphenous vein graft failure.
J Am Coll Cardiol. 2004 Jul 7;44(1):53-6.
PMID: 15234406 [PubMed - indexed for MEDLINE]

☐ **2:** Simoons ML, Bobbink IW, Boland J, Gardien M, Klootwijk P, Lensing AW, Ruzyllo W, Umans VA, Vahanian A, Van De Werf F, Zeymer U; PENTUA Investigators. Related Articles

A dose-finding study of fondaparinux in patients with non-ST-segment elevation acute coronary syndromes: the Pentasaccharide in Unstable Angina (PENTUA Study).
J Am Coll Cardiol. 2004 Jun 16;43(12):2183-90.
PMID: 15193678 [PubMed - indexed for MEDLINE]

☐ **3:** Forlani S, Tomai F, De Paulis R, Turani F, Colella DF, Nardi P, De Notaris S, Moscarelli M, Magliano G, Crea F, Chiariello L. Related Articles

Preoperative shift from glibenclamide to insulin is cardioprotective in diabetic patients undergoing coronary artery bypass surgery.
J Cardiovasc Surg (Torino). 2004 Apr;45(2):117-22.
PMID: 15179345 [PubMed - indexed for MEDLINE]

☐ **4:** Chang SM, Yazbek N, Lakkis NM. Related Articles

Use of statins prior to percutaneous coronary intervention reduces myonecrosis and improves clinical outcome.
Catheter Cardiovasc Interv. 2004 Jun;62(2):193-7.
PMID: 15170709 [PubMed - in process]

☐ **5:** Bazzino O, Fuselli JJ, Botto F, Perez De Arenaza D, Bahit C, Dadone J; PACS group of investigators. Related Articles

Relative value of N-terminal probrain natriuretic peptide, TIMI risk score, ACC/AHA prognostic classification and other risk markers in patients with ST-elevation acute coronary syndromes.
Eur Heart J. 2004 May;25(10):859-66.
PMID: 15140534 [PubMed - indexed for MEDLINE]

☐ **6:** Psychari SN, Iliodromitis EK, Hamodraka E, Liakos G, Velissaridou A, Apostolou TS, Kremastinos DT. Related Articles

Preinfarction angina does not alter infarct size and in hospital outcome after myocardial infarction with ST elevation.
Int J Cardiol. 2004 Apr;94(2-3):187-91.
PMID: 15093979 [PubMed - indexed for MEDLINE]

☐ **7:** Nagai R. Related Articles

-  [Recent progress in diagnosis of and therapy for angina pectoris]
Nippon Naika Gakkai Zasshi. 2004 Mar 10;93(3):545-50. Review. Japanese. No abstract available.
PMID: 15052818 [PubMed - indexed for MEDLINE]
-  **8:** Dudek D, Bartus S, Zmudka K, Legutko J, Turek P, Rzeszutko A, Chyrchel M, Dubiel JS. Related Articles
[Safety and efficacy of ANGIOGUARD protection device for the prevention of distal embolization during PCI in patients with unstable angina]
Przegl Lek. 2003;60(8):499-503. Polish.
PMID: 14974339 [PubMed - indexed for MEDLINE]
-  **9:** Wiviott SD, Cannon CP, Morrow DA, Murphy SA, Gibson CM, McCabe CH, Sabatine MS, Rifai N, Giugliano RP, DiBattiste PM, Demopoulos LA, Antman EM, Braunwald E. Related Articles
Differential expression of cardiac biomarkers by gender in patients with unstable angina/non-ST-elevation myocardial infarction: a TACTICS-TIMI 18 (Treatment of Angina with Aggrastat and determine Cost of Therapy with an Invasive or Conservative Strategy-Thrombolysis In Myocardial Infarction 18) substudy.
Circulation. 2004 Feb 10;109(5):580-6.
PMID: 14769678 [PubMed - indexed for MEDLINE]
-  **10:** Weisel RD, Lipton IH, Lyall RN, Baird RJ. Related Articles
Cardiac metabolism and performance following cold potassium cardioplegia.
Circulation. 1978 Sep;58(3 Pt 2):I217-26.
PMID: 14740705 [PubMed - indexed for MEDLINE]
-  **11:** Hamm CW; Deutsche Gesellschaft für Kardiologie- Herz- und Kreislaufforschung. Related Articles
[Guidelines: acute coronary syndrome (ACS). 1: ACS without persistent ST-segment elevations]
Z Kardiol. 2004 Jan;93(1):72-90. German. No abstract available.
PMID: 14740245 [PubMed - indexed for MEDLINE]
-  **12:** Kini AS, Lee PC, Mitre CA, Kim MC, Kamran M, Duffy ME, Marmur JD, Sharma SK. Related Articles
Prediction of outcome after percutaneous coronary intervention for the acute coronary syndrome.
Am J Med. 2003 Dec 15;115(9):708-14.
PMID: 14693323 [PubMed - indexed for MEDLINE]
-  **13:** Mark B, Schneider S, Schiele R, Taubert G, Kilkowski C, Seidl K, Nagel D, Seiler D, Senges J, Zahn R. Related Articles
Comparison of different cardiac markers in monitoring percutaneous coronary interventions with frequent use of stents and gpIIb/IIIa-antagonists.
Z Kardiol. 2003 Dec;92(12):1018-24.
PMID: 14663612 [PubMed - indexed for MEDLINE]
-  **14:** Nageh T, Sherwood RA, Harris BM, Byrne JA, Thomas MR. Related Articles
Cardiac troponin T and I and creatine kinase-MB as markers of myocardial injury and predictors of outcome following percutaneous coronary intervention.
Int J Cardiol. 2003 Dec;92(2-3):285-93.
PMID: 14659867 [PubMed - indexed for MEDLINE]
-  **15:** Wang X, Wei M, Kuukasjarvi P, Laurikka J, Jarvinen O, Rinne T, Honkonen EL, Tarkka M. Related Articles

-  Novel pharmacological preconditioning with diazoxide attenuates myocard stunning in coronary artery bypass grafting.
Eur J Cardiothorac Surg. 2003 Dec;24(6):967-73.
PMID: 14643816 [PubMed - indexed for MEDLINE]
-  **16:** Jozan-Jilling M, Horvath I, Kis E, Bodnar I, Baross M, Zsigmond A, Kovacs E, Papp L. Related Articles
[Facilitated revascularisation in myocardial infarction with ST-segment elevation]
Orv Hetil. 2003 Aug 10;144(32):1583-6. Hungarian.
PMID: 12974183 [PubMed - indexed for MEDLINE]
-  **17:** Iliou MC, Fumeron C, Benoit MO, Tuppin P, Calonge VM, Moatti N, Buisson C, Jacquot C. Related Articles
Prognostic value of cardiac markers in ESRD: Chronic Hemodialysis and Cardiac Markers Evaluation (CHANCE) study.
Am J Kidney Dis. 2003 Sep;42(3):513-23.
PMID: 12955679 [PubMed - indexed for MEDLINE]
-  **18:** Okmen E, Cakmak M, Tartan Z, Cam N. Related Articles
 Effects of glycoprotein IIb/IIIa inhibition on clinical stabilization parameters in patients with unstable angina and non-Q-wave myocardial infarction.
Heart Vessels. 2003 Jul;18(3):117-22.
PMID: 12955426 [PubMed - indexed for MEDLINE]
-  **19:** Leborgne L, Cheneau E, Pichard A, Ajani A, Pakala R, Yazdi H, Satler L, Kent K, Suddath WO, Pinnow E, Canos D, Waksman R. Related Articles
 Effect of direct stenting on clinical outcome in patients treated with percutaneous coronary intervention on saphenous vein graft.
Am Heart J. 2003 Sep;146(3):501-6.
PMID: 12947370 [PubMed - indexed for MEDLINE]
-  **20:** Christenson RH, Leino EV, Giugliano RP, Bahr RD. Related Articles
 Usefulness of prodromal unstable angina pectoris in predicting better survival and smaller infarct size in acute myocardial infarction (The InTIME-II Prodromal Symptoms Substudy).
Am J Cardiol. 2003 Sep 1;92(5):598-600.
PMID: 12943885 [PubMed - indexed for MEDLINE]
-  **21:** Ferreira R. Related Articles
 New diagnostic criteria of acute myocardial infarction.
Rev Port Cardiol. 2003 May;22(5):735-40. No abstract available.
PMID: 12940186 [PubMed - indexed for MEDLINE]
-  **22:** Boyce SW, Bartels C, Bolli R, Chaitman B, Chen JC, Chi E, Jessel A, Kereiakes D, Knight J, Thulin L, Theroux P; GUARD During Ischemia Against Necrosis (GUARDIAN) Study Investigators. Related Articles
 Impact of sodium-hydrogen exchange inhibition by cariporide on death or myocardial infarction in high-risk CABG surgery patients: results of the CASSIS surgery cohort of the GUARDIAN study.
J Thorac Cardiovasc Surg. 2003 Aug;126(2):420-7.
PMID: 12928639 [PubMed - indexed for MEDLINE]
-  **23:** Matsumoto Y, Endo M, Kasashima F, Abe Y, Kosugi I, Sasaki H. Related Articles
 [Off-pump coronary artery bypass grafting for octogenarians with acute

coronary syndrome]

Kyobu Geka. 2003 Jul;56(8 Suppl):682-7. Japanese.
PMID: 12910951 [PubMed - indexed for MEDLINE]

-  **24:** Yin R, Feng J, Chen D, Wu H.

Related Articles

Serum levels of vascular endothelial growth factor in patients with angina pectoris and acute myocardial infarction.

Chin Med Sci J. 2000 Dec;15(4):205-9.

PMID: 12906138 [PubMed - indexed for MEDLINE]

-  **25:** Kizer JR, Muttref MR, Matthai WH, McConnell J, Nardone H, Sonel AF, Keane MG, Wilensky RL.

Related Articles

Role of cardiac troponin T in the long-term risk stratification of patients undergoing percutaneous coronary intervention.

Eur Heart J. 2003 Jul;24(14):1314-22.

PMID: 12871688 [PubMed - indexed for MEDLINE]

-  **26:** Mahmud E, Shaw KD, Penny WF.

Related Articles

Patients at low risk for periprocedural myocardial infarction can be identified by immediate assessment immediately following percutaneous coronary intervention.

J Invasive Cardiol. 2003 Jun;15(6):343-7.

PMID: 12777674 [PubMed - indexed for MEDLINE]

-  **27:** Capellan O, Hollander JE, Pollack C Jr, Hoekstra JW, Wilke E, Tiffany B, Sites FD, Shofer FS, Gibler WB.

Related Articles

Prospective evaluation of emergency department patients with potential coronary syndromes using initial absolute CK-MB vs. CK-MB relative index.

J Emerg Med. 2003 May;24(4):361-7.

PMID: 12745035 [PubMed - indexed for MEDLINE]

-  **28:** Prati F, Pawlowski T, Gil R, Labellarte A, Gziut A, Caradonna E, Manzoli A, Pappalardo A, Burzotta F, Boccanelli A.

Related Articles

Stenting of culprit lesions in unstable angina leads to a marked reduction in plaque burden: a major role of plaque embolization? A serial intravascular ultrasound study.

Circulation. 2003 May 13;107(18):2320-5. Epub 2003 Apr 21.

PMID: 12707236 [PubMed - indexed for MEDLINE]

-  **29:** Svensson L, Isaksson L, Axelsson C, Nordlander R, Herlitz J.

Related Articles

Predictors of myocardial damage prior to hospital admission among patients with acute chest pain or other symptoms raising a suspicion of acute coronary syndrome.

Coron Artery Dis. 2003 May;14(3):225-31.

PMID: 12702926 [PubMed - indexed for MEDLINE]

-  **30:** Boufous S, Kelleher PW, Pain CH, Dann LM, Ieraci S, Jalaludin BB, Gray AL, Harris SE, Juergens CP.

Related Articles

Impact of a chest-pain guideline on clinical decision-making.

Med J Aust. 2003 Apr 21;178(8):375-80.

PMID: 12697008 [PubMed - indexed for MEDLINE]

-  **31:** Lafuente Gormaz C, Terrance de Juan I, Broseta Viana L.

Related Articles

[Cardiac troponins and their current clinical application]

Med Clin (Barc). 2003 Mar 22;120(10):389-94. Review. Spanish. No abstract available.

PMID: 12681105 [PubMed - indexed for MEDLINE]
